## **Executive Summary: Air Quality in Our Area**

### Air Quality in East Cambridgeshire

Air pollution is associated with a number of adverse health impacts. It is recognised as a contributing factor in the onset of heart disease and cancer. Additionally, air pollution particularly affects the most vulnerable in society: children and older people, and those with heart and lung conditions. There is also often a strong correlation with equalities issues, because areas with poor air quality are also often the less affluent areas<sup>1,2</sup>.

The annual health cost to society of the impacts of particulate matter alone in the UK is estimated to be around £16 billion<sup>3</sup>.

This ASR relates to data gathered between 1st January and 31st December 2017. East Cambridgeshire is predominantly rural in character and air quality is relatively good. Statutory objectives are being met at all monitoring locations and the council has not designated any areas as Air Quality Management Areas. As in most other parts of the country road traffic emissions are the principal source of poor air quality. Nitrogen dioxide (NO<sub>2</sub>) and particulates are the main contaminants of concern and East Cambridgeshire District Council currently monitors NO<sub>2</sub> levels at 21 sites across the district. Overall, there has been a gradual downward trend in annual mean NO<sub>2</sub> concentrations in recent years. In 2017 annual mean NO<sub>2</sub> concentrations declined at 13 of the 17 long term monitoring diffusion tube locations compared to 2016, rose slightly at three and remained the same at one (see Figure A.1). There is one area of relatively poor air quality in the district at Station Road, Ely which is subject to high traffic volumes. However, there is limited public exposure to the air quality in this area and recent road improvements are likely to lead to an improvement in air quality.

In October 2016 additional diffusion tubes were deployed on a temporary basis in the villages of Haddenham, Wilburton and Sutton in order to investigate the effects on air quality of traffic passing through those villages to avoid the busier main roads.

Monitoring at these locations was continued until the end of March 2017. Two of these locations at High Street, Wilburton, and The Brook, Sutton have been added to

<sup>&</sup>lt;sup>1</sup> Environmental equity, air quality, socioeconomic status and respiratory health, 2010

<sup>&</sup>lt;sup>2</sup> Air quality and social deprivation in the UK: an environmental inequalities analysis, 2006

<sup>&</sup>lt;sup>3</sup> Defra. Abatement cost guidance for valuing changes in air quality, May 2013

the monitoring programme to give a more comprehensive coverage of the district. An extra background location at Granta Close, Witchford has also been added. The automatic monitoring station AS1 at Station Road, Ely was closed down in early January 2017 due to the expiry of the lease and the absence of suitable alternative accommodation. In preparation for this an additional diffusion tube location, NAS21, was established in October 2016 close to the former location of AS1. Although this location is not representative of public exposure, recording has been continued in order to evaluate the effect on NO<sub>2</sub> levels in the area when the Ely Southern By-pass opens in late summer 2018.

As well as meeting the annual mean air quality objective of  $40 \,\mu\text{g/m}^3$  for  $NO_2$  all of the individual monthly  $NO_2$  levels were less than  $40 \,\mu\text{g/m}^3$  with the exception of a single result for NAS18, High Street, Wilburton which recorded a value of  $41.3 \,\mu\text{g/m}^3$  in December 2017. This monitoring point is close to the junction of the A1123 and B1049 which experiences high traffic flows at peak times. Higher localized  $NO_2$  levels can occur during the winter months when weather conditions can retard the dispersion of poor quality air.

This ASR has not identified the need to proceed to a Detailed Assessment for any pollutants. No new significant emission sources have been identified which could lead to poor air quality in the district. East Cambridgeshire District Council will continue to operate the NO<sub>2</sub> diffusion tube monitoring programme to ensure that air quality objectives continue to be met. The council will compile and submit a further ASR in 2019.

### **Actions to Improve Air Quality**

Although air quality in East Cambridgeshire is relatively good, the council supports any actions to maintain and improve air quality. East Cambridgeshire District Council is working with Cambridgeshire County Council (CCC) to bring about improvements in transport infrastructure; and construction of the A142 Ely Southern Bypass began in April 2017. The new road will open in late summer 2018 and will remove the traffic which is the source of poor air quality in Station Road and Angel Drove. The two councils have developed a Transport Strategy for East Cambridgeshire with a view to improving transport links in the district and reducing negative impacts on air quality.

#### **Conclusions and Priorities**

Rapid population growth and an increase in demand for new housing in the district may lead to an increase in road traffic which can have a negative impact on air quality. The council's main priority is to ensure that good air quality is maintained across the district at a time of increased development pressure.

East Cambridgeshire District Council has taken forward a number of direct measures during the current reporting year of 2017 in pursuit of improving local air quality. As well as contributing to the cost of the Ely Southern By-pass the council carried out extra monitoring in villages affected by road traffic and provided extra car parking at Ely and Littleport railway stations to encourage rail travel.

The council will continue to help bring about improvements in air quality by working with Cambridgeshire County Council to implement the objectives of the Transport Strategy for East Cambridgeshire.

Cambridgeshire Health and Wellbeing Board has approved a number of Joint Strategic Needs Assessments (JSNA). These help determine what actions local authorities, the NHS and others need to take to meet local health and social care needs; and also to address the wider determinants that impact on public health and wellbeing such as traffic and air quality. The Transport and Health JSNA includes an Air Pollution section and recommends that future actions focus on:

- Introducing low emission passenger fleets and vehicles
- Encouraging walking and cycling rather than car use
- Further assessment of shorter term measures to reduce exposure

East Cambridgeshire District Council will work with Cambridgeshire County Council towards achieving these aims.

The strategy supports measures to reduce heavy traffic through towns and villages and encourages all traffic to use the most appropriate route with a particular focus on heavy commercial vehicles with all non-local traffic encouraged to use the strategic road networks.

## Local Engagement and How to get involved

East Cambridgeshire District Council encourages the public to help improve air quality by trying to reduce the number of car journeys undertaken, choosing a low emission vehicle, switching off car engines when stationary; and by walking, cycling, and using public transport wherever possible.

## 1 Local Air Quality Management

This report provides an overview of air quality in East Cambridgeshire during 2017. It fulfils the requirements of Local Air Quality Management (LAQM) as set out in Part IV of the Environment Act (1995) and the relevant Policy and Technical Guidance documents.

The LAQM process places an obligation on all local authorities to regularly review and assess air quality in their areas, and to determine whether or not the air quality objectives are likely to be achieved. Where an exceedance is considered likely the local authority must declare an Air Quality Management Area (AQMA) and prepare an Air Quality Action Plan (AQAP) setting out the measures it intends to put in place in pursuit of the objectives. This Annual Status Report (ASR) is an annual requirement showing the strategies employed by East Cambridgeshire District Council to improve air quality and any progress that has been made.

The statutory air quality objectives applicable to LAQM in England can be found in Table E.1 in Appendix E.

## 2 Actions to Improve Air Quality

## 2.1 Air Quality Management Areas

Air Quality Management Areas (AQMAs) are declared when there is an exceedance or likely exceedance of an air quality objective. After declaration, the authority must prepare an Air Quality Action Plan (AQAP) within 12-18 months setting out measures it intends to put in place in pursuit of compliance with the objectives.

East Cambridgeshire District Council currently does not have any AQMAs. For reference, maps of East Cambridgeshire District Council's monitoring locations are provided in Appendix D.

## 2.2 Progress and Impact of Measures to address Air Quality in East Cambridgeshire

DEFRA's appraisal of last year's ASR concluded that air quality targets were being met in East Cambridgeshire. As in most other parts of the country road traffic emissions are the principal source of poor air quality.

East Cambridgeshire District Council has taken forward a number of direct measures during the current reporting year of 2017 in pursuit of improving local air quality. Details of all measures completed, in progress or planned are set out in Table 2.1.

Key completed measures are:

- commencement of construction work on the A142 Ely Southern By-pass and implementation of the Transport Strategy for East Cambridgeshire.
- provision of extra parking at Ely and Littleport railway stations to encourage rail travel

East Cambridgeshire District Council expects the following measure to be completed over the course of the next reporting year:

- the A142 Ely Southern By-pass to be open for traffic with an improvement in air quality in the Angel Drove and Station Road area
- adoption of revised Local Plan to include policies to encourage the use of electric vehicles

East Cambridgeshire District Council's priorities for the coming year are:

- to continue to monitor NO<sub>2</sub> concentrations throughout the district
- to regularly review the monitoring network locations to ensure that any hotspots are identified
- to encourage walking and cycling rather than car use

The principal challenges and barriers to implementation that East Cambridgeshire District Council anticipates facing are the requirements to maintain and improve air quality at a time of increased development pressure across the district. East Cambridgeshire has been set a target of delivering 11,500 new dwellings and 9,200

additional jobs in the current local plan period which runs up to 2031. These developments have the potential to significantly impact air quality.

## 2.3 PM<sub>2.5</sub> – Local Authority Approach to Reducing Emissions and/or Concentrations

As detailed in Policy Guidance LAQM.PG16 (Chapter 7), local authorities are expected to work towards reducing emissions and/or concentrations of PM<sub>2.5</sub> (particulate matter with an aerodynamic diameter of 2.5µm or less). There is clear evidence that PM<sub>2.5</sub> has a significant impact on human health, including premature mortality, allergic reactions, and cardiovascular diseases.

Under the Health and Social Care Act 2012 the government introduced a Public Health Outcomes Framework (PHOF) which sets out key indicators of the state of public health and includes an indicator relating to air pollution:

• 3.01- Fraction of mortality attributable to particulate air pollution.

This was estimated as 5.2% in 2016, 0.2 percentage points below the average for the East of England.

East Cambridgeshire District Council does not carry out monitoring or take any measures to specifically address PM<sub>2.5</sub> concentrations. However, measures to reduce road traffic emissions generally are likely to reduce emissions of PM<sub>2.5</sub>.

East Cambridgeshire District Council is taking the following measures to address PM<sub>2.5</sub>:

- Working with Cambridgeshire County Council through the Transport Strategy for East Cambridgeshire to prioritise sustainable transport alternatives and reduce congestion
- Encouraging healthy and active travel and supporting people's wellbeing
- Requiring applicants to provide Construction Environment Management
  Plans to minimise the production of PM<sub>2.5</sub> and other particulates which
  might arise during construction work in considering applications for
  planning approvals for new development under Town and Country
  Planning.

## 3 Air Quality Monitoring Data and Comparison with Air Quality Objectives and National Compliance

### 3.1 Summary of Monitoring Undertaken

#### 3.1.1 Automatic Monitoring Sites

East Cambridgeshire District Council did not undertake any automatic (continuous) monitoring in 2017. The Council's single automatic monitoring station NAS1 at Station Road, Ely was decommissioned in early January 2017 as the site housing the equipment was no longer available due to the expiry of the lease and the absence of alternative accommodation. Also, road improvements which are underway are likely to bring about improvements in air quality and there is no longer any necessity to consider the declaration of an Air Quality Management Area. Therefore, detailed monitoring data is no longer required

#### 3.1.2 Non-Automatic Monitoring Sites

East Cambridgeshire District Council undertook non-automatic (passive) monitoring of NO<sub>2</sub> using diffusion tubes. The network was extended from 17 sites in 2016 to 21 sites in 2017. Table A.1 in Appendix shows site details.

Maps showing the locations of the monitoring sites are provided in Appendix D. Further details on Quality Assurance/Quality Control (QA/QC) for the diffusion tubes, including bias adjustments and any other adjustments applied (e.g. "annualisation" and/or distance correction), are included in Appendix C.

#### 3.2 Individual Pollutants

The air quality monitoring results presented in this section are, where relevant, adjusted for bias, "annualisation" and distance correction. Further details on adjustments are provided in Appendix C.

#### 3.2.1 Nitrogen Dioxide (NO<sub>2</sub>)

Table A2 in Appendix A compares the ratified and adjusted monitored NO<sub>2</sub> annual mean concentrations for the past 5 years with the air quality objective of 40µg/m<sup>3</sup>. All data from the 21 NO<sub>2</sub> diffusion tube monitoring sites were within the air quality annual mean objective.

Decreases in NO<sub>2</sub> concentrations were recorded at 13 of the 17 long term monitoring locations compared with the results for 2016. Rises in NO<sub>2</sub> concentrations were recorded at three sites. A graph showing trends in annual mean NO<sub>2</sub> concentrations over time is shown in Figure A1 in Appendix A. The graph indicates a general downward trend in NO<sub>2</sub> concentrations since 2008. The annual means plotted are the bias adjusted annual mean values without distance correction.

The relatively poor air quality recorded at Station Road, Ely is due to high traffic flows and queuing traffic on the A142 in Station Road and Angel Drove. This road carries approximately 15,000 vehicles per day of which 8% are HGVs. The road passes under the Ely to Kings Lynn railway line to the north of the station via an underpass which has a height restriction. Taller vehicles must use the adjacent level crossing. Increases in passenger and freight rail traffic in recent years mean that the level crossing is now closed for around 40 minutes per hour during the day. When the gates are closed heavy traffic queues back on to the main carriageway blocking access to the underpass for smaller vehicles. Construction of the new A142 Ely Southern Bypass is in progress and the road will open in the late summer of 2018. The road will connect the A142 at Angel Drove to Stuntney Causeway and will largely remove the source of poor air quality in the area.

NAS3 in Station Road shows an apparent rise in annual mean  $NO_2$  concentrations from 20.4  $\mu$ g/m³ in 2016 to 30.9  $\mu$ g/m³ in 2017, an increase of 10.5  $\mu$ g/m³. However, this is most likely due to the fact that the tube was moved from its original location on the northbound side of the road to its present location on the southbound side following the loss of two tubes in January and February 2017. Although the distance between these two points is only c.15m, heavy goods vehicles queue on the southbound side of the road to use the rail crossing, whereas traffic on the northbound side near to the original location flows relatively freely. It is likely that the apparent rise reflects this change in monitoring location rather than any real increase in  $NO_2$  concentrations as the new location is much closer to the stationary traffic. For this reason the 2017 result has not been included in the trend graph in Figure A1. The results for NAS3 demonstrate how high  $NO_2$  concentrations can fall off quite rapidly with distance.

## **Appendix A: Monitoring Results**

☑ Diffusion tube data has been bias corrected

☑ Annualisation has been conducted where data capture is <75%
</p>

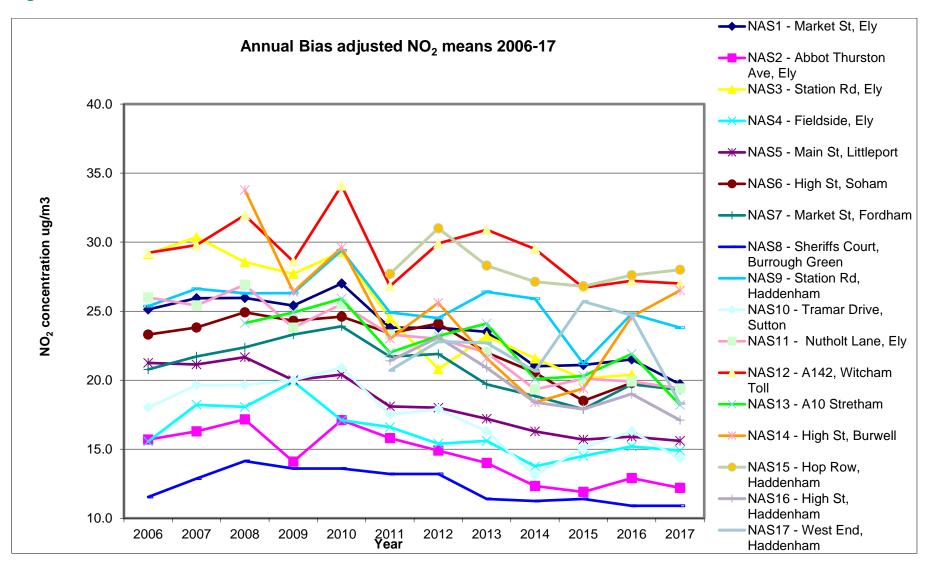

#### Notes:

Exceedances of the NO<sub>2</sub> annual mean objective of 40µg/m³ are shown in **bold**.

NO<sub>2</sub> annual means exceeding 60µg/m<sup>3</sup>, indicating a potential exceedance of the NO<sub>2</sub> 1-hour mean objective are shown in **bold and underlined**.

- (1) Data capture for the monitoring period, in cases where monitoring was only carried out for part of the year.
- (2) Data capture for the full calendar year (e.g. if monitoring was carried out for 6 months, the maximum data capture for the full calendar year is 50%).
- (3) Means for diffusion tubes have been corrected for bias. All means have been "annualised" as per Boxes 7.9 and 7.10 in LAQM.TG16 if valid data capture for the full calendar year is less than 75%. See Appendix C for details.

☐ Local bias adjustment factor used

☑ Annualisation has been conducted where data capture is <75%
</p>

☑ Where applicable, data has been distance corrected for relevant exposure

#### Notes:

Exceedances of the NO<sub>2</sub> annual mean objective of 40µg/m³ are shown in **bold**.

NO<sub>2</sub> annual means exceeding 60µg/m<sup>3</sup>, indicating a potential exceedance of the NO<sub>2</sub> 1-hour mean objective are shown in **bold and underlined**.

- (1) See Appendix C for details on bias adjustment and annualisation.
- (2) Distance corrected to nearest relevant public exposure.

## **Appendix C: Supporting Technical Information / Air Quality Monitoring Data QA/QC**

#### **Diffusion Tube Bias Adjustment Factors**

Diffusion tube values have been multiplied by a bias correction factor of 0.77 obtained from the DEFRA LAQM Helpdesk national bias adjustment database (version 09/17).

#### **Discussion of Choice of Factor to Use**

No local co-location information was available so a bias adjustment factor was obtained from the national bias adjustment database which is available at: <a href="http://laqm.defra.gov.uk/bias-adjustment-factors/national-bias.html">http://laqm.defra.gov.uk/bias-adjustment-factors/national-bias.html</a>.

Adjustment factors are derived from data from diffusion tubes which were co-located with real-time analysers.

Entering the parameters for ESG Didcot, and a 50% triethanolamine (TEA) in acetone preparation method for 2017 gave an adjustment factor of 0.77 which was applied to the East Cambridgeshire District Council data.

#### **QA/QC** of Diffusion Tube Monitoring

The diffusion tubes were supplied and analysed by:

SOCOTEC (Formerly Environmental Scientifics Group (ESG))
Unit 12, Moorbrook
Southmead Industrial Estate
Didcot,
Oxfordshire OX11 7HP

The tubes were prepared by spiking acetone: triethanolamine (50:50) onto the grids prior to being assembled.

The DEFRA Local Air Quality Management Helpdesk publishes information on laboratory performance in the precision of diffusion tube analysis. This can be found at: <a href="http://laqm.defra.gov.uk/diffusion-tubes/precision.html">http://laqm.defra.gov.uk/diffusion-tubes/precision.html</a>

For the purpose of LAQM tube precision is classed as Good or Poor. For the purposes of Local Air Quality Management, tube precision is separated into two categories, "Good" or "Poor", as follows: tubes are considered to have "good" precision where the coefficient of variation (CV) of duplicate or triplicate diffusion tubes for eight or more periods during the year is less than 20%, and the average CV

of all monitoring periods is less than 10%. Tubes are considered to have "poor" precision where the CV of four or more periods is greater than 20% and/or the average CV is greater than 10%.

The distinction between "good" and "poor" precision is an indicator of how well the same measurement can be reproduced. This precision will reflect the laboratory's performance/consistency in preparing and analysing the tubes, as well as the subsequent handling of the tubes in the field. Any laboratory can show "poor" precision for a particular period/co-location study, if this is due to poor handling of the tubes in the field. In 2017 ESG Didcot received a rating of Good in all 29 studies for 50% TEA in acetone.

The AIR/WASP (Workplace Analysis scheme for Proficiency) NO<sub>2</sub> proficiency testing scheme is an independent analytical testing scheme operated on behalf of DEFRA and the Devolved Administrations to test laboratory proficiency. Details of laboratory performance can be found at: <a href="http://laqm.defra.gov.uk/diffusion-tubes/qa-qc-framework.html">http://laqm.defra.gov.uk/diffusion-tubes/qa-qc-framework.html</a>. ESG Didcot achieved a score of 100% Satisfactory in all proficiency testing rounds in 2017.

#### NO2 Fall-off with distance calculator

This Excel tool has been developed by DEFRA to help local authorities derive the NO<sub>2</sub> concentration at locations relevant for exposure as it is not always possible to measure concentrations at precisely the desired location. The calculator allows you to predict the annual mean NO<sub>2</sub> concentration for a location ("receptor") that is close to a monitoring site. The monitoring can either be closer to the kerb than the receptor, or further from the kerb than the receptor.

The closer the monitor and the receptor are to each other, the more reliable the prediction will be. The methodology consists of comparing the monitored annual mean NO<sub>2</sub> concentrations at a given point against known relationships between NO<sub>2</sub> concentrations and the distance from a road source.

For information about the restrictions on the application of this tool, please see the "Limitations" tab. Any further information with regards to the use of this tool is provided within LAQM.TG(16).

Background values were obtained from the DEFRA website. <a href="https://uk-air.defra.gov.uk/data/laqm-background-maps?year=2013">https://uk-air.defra.gov.uk/data/laqm-background-maps?year=2013</a>

Table C.1 - NO2 Fall-off with distance corrections

|                              | Distan                        | ce (m)              | NO₂ Annual | Mean Concent         | ration (µg/m³)           |
|------------------------------|-------------------------------|---------------------|------------|----------------------|--------------------------|
| Site Name/ID                 | Monitoring<br>Site to<br>Kerb | Receptor<br>to Kerb | Background | Monitored<br>at Site | Predicted at<br>Receptor |
| NAS5 - Littleport            | 1.6                           | 5.8                 | 8.3        | 15.6                 | 13.5                     |
| NAS12 – A142<br>Witcham Toll | 2.7                           | 4.5                 | 9          | 27                   | 24.7                     |
| NAS13 – A10<br>Stretham      | 3.2                           | 14                  | 8.6        | 18.2                 | 14.5                     |
| NAS19 – The Brook,<br>Sutton | 1.3                           | 13.3                | 8          | 18.8                 | 13.5                     |

## **Appendix D: Maps of Monitoring Locations**

Figure D.1 - Map of Air Quality Monitoring Sites in East Cambridgeshire

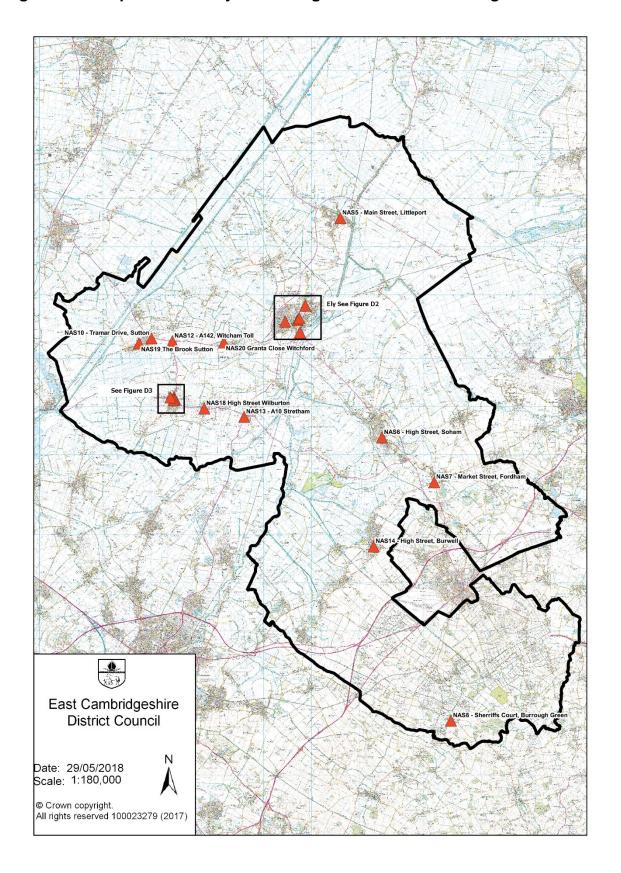

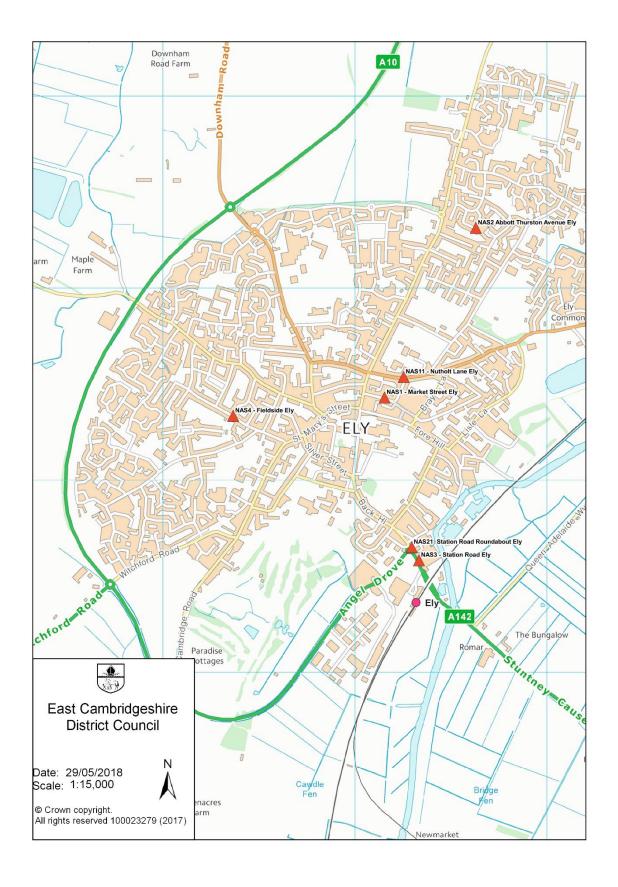

Figure D.2 - Map of Air Quality Monitoring Sites in Ely

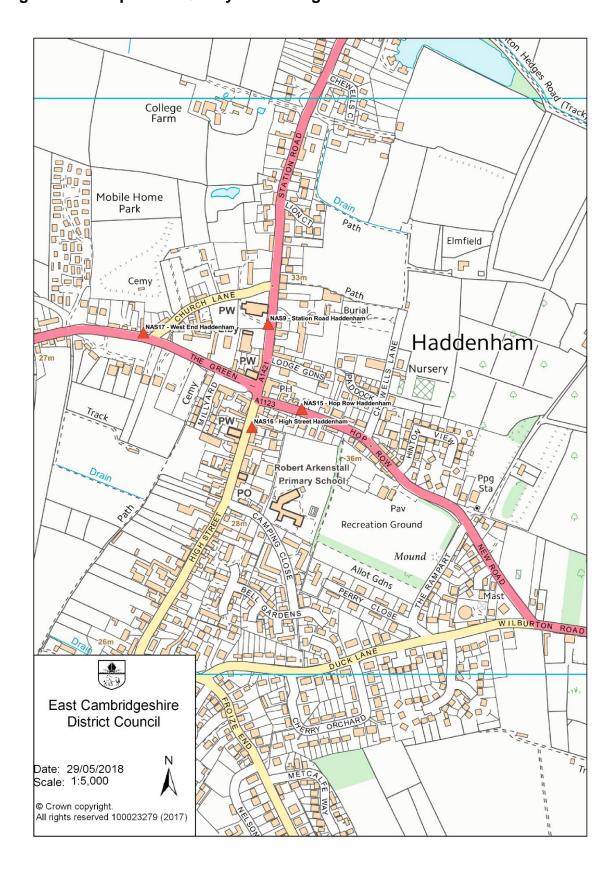

Figure D.3 - Map of Air Quality Monitoring Sites in Haddenham

## **Appendix E: Summary of Air Quality Objectives in England**

Table E.1 – Air Quality Objectives in England

| Pollutant                           | Air Quality Objective <sup>4</sup>                      |                |
|-------------------------------------|---|----------------|
| Poliularit                          | Concentration   | Measured as    |
| Nitrogen Dioxide (NO <sub>2</sub> ) | 200 µg/m³ not to be exceeded more than 18 times a year  | 1-hour mean    |
| (1402)                              | 40 μg/m <sup>3</sup>                                    | Annual mean    |
| Particulate Matter                  | 50 μg/m³, not to be exceeded more than 35 times a year  | 24-hour mean   |
| (PM <sub>10</sub> )                 | 40 μg/m <sup>3</sup>                                    | Annual mean    |
|                                     | 350 µg/m³, not to be exceeded more than 24 times a year | 1-hour mean    |
| Sulphur Dioxide (SO <sub>2</sub> )  | 125 µg/m³, not to be exceeded more than 3 times a year  | 24-hour mean   |
|                                     | 266 µg/m³, not to be exceeded more than 35 times a year | 15-minute mean |

 $<sup>^4</sup>$  The units are in microgrammes of pollutant per cubic metre of air ( $\mu g/m^3$ ).

## **Glossary of Terms**

| Abbreviation      | Description   |
|-------------------|---|
| AQAP              | Air Quality Action Plan - A detailed description of measures, outcomes, achievement dates and implementation methods, showing how the local authority intends to achieve air quality limit values'    |
| AQMA              | Air Quality Management Area – An area where air pollutant concentrations exceed / are likely to exceed the relevant air quality objectives. AQMAs are declared for specific pollutants and objectives |
| ASR               | Air quality Annual Status Report  |
| CCC               | Cambridgeshire County Council   |
| DEFRA             | Department for Environment, Food and Rural Affairs  |
| ECDC              | East Cambridgeshire District Council  |
| ESG               | Environmental Scientifics Group   |
| EU                | European Union  |
| JSNA              | Joint Strategic Needs Assessment  |
| LAQM              | Local Air Quality Management  |
| NO <sub>2</sub>   | Nitrogen Dioxide  |
| NO <sub>x</sub>   | Nitrogen Oxides   |
| PM <sub>10</sub>  | Airborne particulate matter with an aerodynamic diameter of 10μm (micrometres or microns) or less   |
| PM <sub>2.5</sub> | Airborne particulate matter with an aerodynamic diameter of 2.5µm or less   |
| QA/QC             | Quality Assurance and Quality Control   |
